_____

Oil-lubricated air compressors tend to be quieter and more durable than other models, making them look like the first choice for dental clinics, but this may not be the case.

The main reason many dentists choose oil-free dental air compressor is that they have a lower risk of contaminating the compressed air with lubricant. These devices are also tend to be lighter, allowing them to be placed in a wide range of areas while still producing as much air flow and pressure as many oil lubricated models.

Eliminating the risk of contaminating the air is the biggest victory and the most rewarding because it protects the health and safety of patients, staff and those in your office waiting areas. Although you need a little maintenance, the health and safety issues clearly outweigh any benefit you&#65533;d see from using the heavier, lubricated models.

The motors of air compressor also plays an important role, such as the Greeloy GM1600 air compressor motor, it features 100% oil free motor, Silent design, Pure air flow and inside thermal protection.
